Grassroots Bitcoin Spending Expands While the Payment Stack Hardens Under Attack

By Bitcoin Payment Adoption Tracker • August 9, 2026

The period pairs completed Bitcoin purchases and new community merchant endpoints with continuing BTCPay fallout, AI-led security work, and a live L402 usage signal.

Major Adoption News

Community use produced several concrete point-of-sale payments rather than acceptance claims alone. Bitcoin Ekasi described a first visit to Blaize & Barrel where the visitor paid with Bitcoin using a self-hosted BTCPay Server and a Bolt Card; the post gives no amount, location, or repeat-use measure. [1] BTC Shule reported that a mother bought soap with Bitcoin through Fedi, linking the merchant's Blink address and BTC Map record; the linked record identifies Kwa Jiyeve in Winteko, shows a Lightning acceptance icon, and associates the listing with BTC Shule. [2, 3] In Calabar, a community post reported lunch paid over Lightning; the linked record identifies Chef Green Signature Local Cusine Hub at Atekong Junction and shows both Lightning and Bitcoin acceptance. [4, 5]

These reports are stronger evidence of payment viability than directory listings or educational claims, but they remain isolated anecdotes: none states transaction value, frequency, or repeat use. [1, 2, 4]

New merchant onboarding continued in everyday food and retail. Bitcoin Babies announced Bobo's Chicken Bites as a new Bitcoin merchant in Kenya and supplied a Lightning address; its BTC Map record shows Lightning acceptance. [6, 7] Bitcoin Dua's post supplied a merchant Blink address for Agbozume; the linked record identifies Antitor Provision Store opposite Agbozume Market, shows both Bitcoin and Lightning acceptance, and ties the listing to

the Bitcoin Dua community. [8, 9] These are useful payment endpoints, but the announcements do not report completed transactions.

Payment Infrastructure

The BTCPay incident continued to create availability and remediation costs for operators. A follow-up post reported that LunaNode had disabled access to all BTCPay instances it hosted until users upgraded, while another follow-up published two addresses linked to exploits of vulnerable BTCPay instances. [10, 11] BTCPay's advisory says the exploited path involved exposed LND `.macaroon` credentials; the risk applied specifically to LND deployments, while BTCPay's on-chain and hot wallets were not affected. [12] Version 2.4.2 also temporarily removed public LND API access on Docker deployments, preventing an external wallet such as Zeus from connecting through a BTCPay domain or Tor address. [12] For merchants, patching therefore affects both custody risk and payment connectivity.

Security work broadened from one emergency patch into ecosystem-wide hardening. Blink's weekly brief said AI-assisted attacks forced Boltz offline, briefly took Satora down, and prompted BTCPay's emergency patch; it also listed AI red-team scans across 150 repositories. [13, 14] A related Bitcoin Red Team update said 25 developers had worked for 108 hours, scanning 501 projects and producing 7,958 findings, including 1,280 rated high or critical; 29.4% of findings had been reported to projects. [15, 16, 17] These figures measure defensive activity, not payment adoption, but they make software assurance a direct operating concern for self-hosted merchants and Lightning services.

Regulatory Landscape

No substantiated country-specific legal-tender, tax, licensing, or transaction-rule change was surfaced in the reviewed current-period material. The practical constraint this period was infrastructure security and service availability rather than a reported change in payment law.

Usage Metrics

Lightning Enable reported that, over the previous 30 days, its protected routes served **18,947 payment challenges across 147 resources**, describing L402 as running in production rather than as a demo. [18] This is a meaningful payment-gate activity signal, but it is not a disclosed count of settled Bitcoin transactions, sat volume, or active payers.

Blink's weekly brief listed BTC Map at **26,575 merchants**. The post provides no methodology or active-status definition, so the figure is best treated as a directory snapshot rather than a measure of transacting merchants. [14] The period's direct-use evidence remains event-level: one restaurant payment, one

soap purchase, and one lunch payment, with no amounts or aggregate transaction counts reported. [1, 2, 4]

Emerging Markets

Local food, household retail, and community education are the clearest expansion pattern. Kenya adds a chicken takeaway with a Lightning endpoint; Agbozume adds a provision store accepting both Bitcoin and Lightning; Winteko adds a BTC Shule-linked household purchase and Lightning merchant listing; and Calabar adds food-service use with both rails listed. [6, 7, 9, 2, 3, 4, 5] The pattern shows payment access being attached to ordinary local commerce, but not yet measured scale.

De Rust / Bitcoin Karoo is building an adoption pipeline around a venue. De Rust Tennisklub was presented as the hub for a Bitcoin Karoo Education Block, combining a bitcoin-only tennis club, a children's tennis and Bitcoin academy, entrepreneurial education, and a bitcoin-only coffee shop. [19] This links education, a local merchant setting, and community infrastructure; it is a pipeline for future usage rather than evidence of current payment volume.

Adoption Outlook

The period supports a stronger grassroots-use signal: Bitcoin was reported in completed restaurant, household, and lunch purchases, while new food and retail endpoints appeared in Kenya, Agbozume, Winteko, and Calabar. [1, 2, 4, 6, 9] At the same time, BTCPay access restrictions, temporary API changes, and AI-linked security incidents show that reliability and operator security remain binding constraints on self-hosted payment infrastructure. [10, 12, 13] The defensible conclusion is broadening experimentation with several instances of real use—not scaled or repeat adoption, for which the corpus still provides no aggregate volume or retention measure. [18, 14, 1, 2, 4]
